

Utility-scale solar design platform created to help developers identify sites together better and faster.

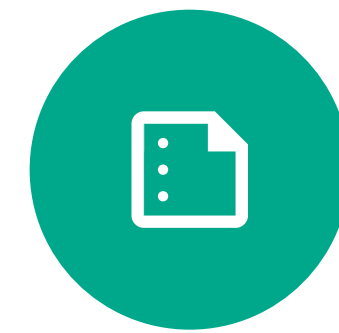

## The problem

Poor and slow site origination due to fractured workflow and lack of solar industry data is costing the U.S. utility scale developer \$5 Billion a year.

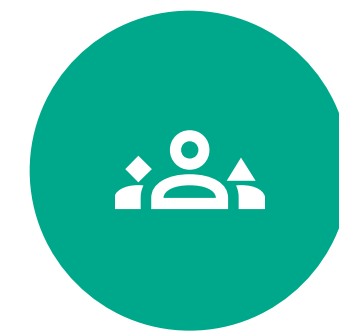

## Site filtering

Filtering number of criteria such as interconnection, parcel, or land data to identify and analyze site quickly.

## Validate design with visualization

Generating preliminary designs layout and generates report to further evaluate the site.

## Live collaboration

Shared designs, Live collaboration, and Geo-commenting enable developer a seamless and collaborative workflow. So the team can spend less time on the wrong projects and optimize for building it well from the start.
