

Welcome to the Battle Ground Solar and Resiliency Project

The Battle Ground Solar and Resiliency Project is a 10-15 year multi phase endeavor. It's a vision of being 75% energy neutral by 2035 and close to 100% by 2050. We are in the first phase of multiple phases. By achieving this will be reducing green house gas emissions, maximize energy efficiencies in multiple areas*, improve energy distribution by embracing distributive energy sources* and in doing so "modernizing" distributive electrical generation*. Individuals, businesses, and organizations will understand it is financially smart ,and responsible, to adopt different infrastructure models and attitudes with their energy usage
