

Summary Slide:

By aligning our new & innovative technologies to mitigate climate resiliency risks and improve the indoor living environment of our tenants the Lac du Flambeau Chippewa Housing Authority plans to transition a 36-year-old 10 -unit apartment building which uses propane as primary heating source to cleaner energy. This will result in reduced carbon emissions and energy cost savings for tenants at the same time helping to preserve Mother Earth. When completed our plan will be easily replicated all across Indian country and our non-Tribal communities!
