

# Energy Efficiency Retrofit Platform

Our innovative energy efficiency retrofit platform, integrated with utilities, will help customers subscribe to available energy efficiency and weatherization programs run by utilities, governments and other stakeholders. Using a holistic approach grounded in the principles of ACCESS, EDUCATE and CONNECT the platform will streamline retrofit processes from financing to implementation while simultaneously uniting a range of stakeholders from consumers, utilities and contractors.

## Access

By qualifying customers and automating their access to IRA benefits the platform aims to simplify access to available and relevant financial incentives. Through stacking diverse financing opportunities, the platform would aim to reduce the direct cost of upgrades to homeowners to support widespread adoption.

## Educate

The platform would not just show incentives but aim to educate users fully on the benefits of combining technologies. For example, how distributed energy resources (DERs) can be connected into a Virtual Power Plant system. Mini-courses will be available and would be specified to user needs.

## Connect

The platform would streamline the selection of energy efficiency retrofit installers in users' local areas to execute building upgrades and turnkey installations. The aim being to streamline installation process while also boosting local green economies.
