

ECOLIBRIUM RampUP/DrawDOWN

How many ways can we...

Reduce emissions and electric bills?

Replace old energy-hog lights and appliances with energy efficient ones

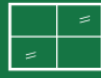

Create unified control systems for aggregate demand / response reduction by making neighborhood buildings grid-interactive

Electrify heating, hot water, and cooling by using energy-efficient electric heat pumps

Increase climate jobs and employment locally by directing our neighbors to training opportunities

Upgrade buildings' windows, roof insulation, and exteriors which reduces their energy use by up to 70%

Help our neighbors access federal and local funding, including ESG/Voluntary Carbon & Demand Response Markets

Install full-roof Solar Canopy PV systems with batteries to generate zero emissions electricity for buildings

Improve indoor and outdoor air quality

What happens when we decide to do all of these at once?
