

## Technical Assistance Request

The areas that I could use assistance is the computer time to validate my calculations. My calculations are making some assumptions based on expected losses. Much of the assumptions in the solar/wind power models that the national labs already have gathered would be useful to compare with my actual dataset.

I know that some of the national labs have done many massive studies combining solar and wind energy power technologies. However, using my concept, I think would be a different approach so I would like the ability to review and compare the different systems with mine.

Of course, getting access to the companies that are currently working with your teams on construction would be needed, I have interfaced with some local companies, but it may be beneficial to be associated with companies that currently are working with you.

I have never been associated with the government and the programs that they have, so guidance in that field will be the most important asset I can have access to. The unique capabilities the national labs, a private facility, and/or members of the American-Made Network could open for me will be the best.
