

Sundial Solar Tracker

Sundial is designing and building the first mass market residential rooftop based solar tracking mount.

These mounts move a solar panel throughout the day to face the sun more directly to generate up to 50% more energy per panel.

This means a customer can cover their energy needs with fewer panels or achieve 50% more energy with the same number of panels.

Sundial's mounts are designed to be low profile by laying flat when not actively tracking. Our mounts are designed for all weather conditions but for safety will automatically react to the weather by auto stowing in case of high winds or precipitation.
