### Technical Assistance Request

The company will be asking well established optic lens manufacturers to partner with DE&E to develop the specific meniscus lens needed to create the lens assemblies.

There are two areas where DE&E will request help from one or more national labs.

First; the lens to be developed will need third party validation for its optic performance and the effects of thermal changes.

Second; DE&E will document the competed system performance in-house but will also look to a national lab to separately document the system's performance over time. This will aid in the commercialization of the end product.

DE&E will also look for assistance in further funding the commercialization of the end product through joint ventures, venture capital or merger with an existing company.
