

Residents Against Indoor Residential Wood Burning

A Canary in a Coal Mine, in British Mines from 1911 to 1986, in 1986 replaced by a Carbon Monoxide monitor. Today we have PM2.5 monitors to protect near neighbors of indoor residential wood burners. Replace wood with Heat Pumps.

The World could be like a crystal cave, with no human caused PM2.5, CO2 or CO emissions from solid fuel burning like coal or wood burning. Wood burning emits more PM2.5 & CO2 than coal burning. Use wind, solar, & geothermal to power a Heat Pump on a smart electric grid extending to all rural areas.
