

Superspans will be a nation-wide contest among engineering schools in the United States to replace decaying bridges with green power-generating facilities.

These designs would solve two problems at once – replace decaying infrastructure, and to provide green energy where it is needed.

The contest would have a variety of categories, and judging would be provided by the contestants themselves, the general public and a panel of green energy experts.

Upon conclusion of the contest, the designs would be presented to the Department of Transportation for review and implementation, savings years in design and millions in cost.

Ultimately, it should grow into an international competition.
