

WE RECYCLE INDIVIDUAL ATOMS FROM E-WASTE:

- 1: Consuming nearly zero chemicals.
- 2: Using the same amount of power as one LED per gram of material.
- 3: Without burning, crushing, or harmful pollutants.

Why We (Electro)Win:

- 7x cheaper
- 66x faster
- 2x safer
- Rapidly deployable
- Comparatively negligible capex
- 99.99% pure gold

How It Works

Aurotect takes a redox-active species to selectively separate target minerals from electronic waste at the atomic level. We electrically turn the system “on” to grab elements and “off” to deposit them for recovery, almost like a one-atom electromagnet for gold, platinum, and iridium atoms.

Where We’re Going

We’re using our extreme cost advantage to solve the massive problem of e-waste collection. We are the only team capable of deploying revenue dollars from recovery into building and deploying collection efforts, rather than passively waiting for legislation or incentives.
