

Community Solar Connections Project

The SEEL Community Solar Connections Project is designed to connect traditionally underserved black and brown communities to solar technology through the following channels:

- **Education**
- **Community Outreach**
- **Workforce Development**
- **Solar Farm Installation, Maintenance and Repair**

These activities will be supported via drone solar panel maintenance processes and agrivoltaics to promote cooler climates around the solar farm, and beautification within the farm.

We will also use the Mobile Solar Demonstration Van as an additional training tool, to reach further in the community and bring technological experience directly to participants.
