

\$47 Billion of precious materials go unreclaimed from e-waste every year. Why? Because e-waste facilities are burdened by many labor-intensive tasks, like sorting, refurbishing, and resale.

We want to change that.

Our robotic system will assess and refurbish laptops with **10x efficiency gain** compared to current approaches.

We're starting with laptops, but our goal is to create the **e-waste facility of the future**, where all devices are processed using computer vision and AI, enabling a more circular electronics industry.
