

Project Hermes: Advancing Clean Energy Manufacturing

Green Power for Green Country

In contrast to its reputation in legacy energy, the Tulsa region, known as Green Country, has been producing renewables since the 1940s. Oklahoma is the **3rd largest producer of wind energy** in the U.S. behind Texas and Iowa.

Clean Energy Manufacturing

Tulsa has expanded its green manufacturing infrastructure with recent wins including:

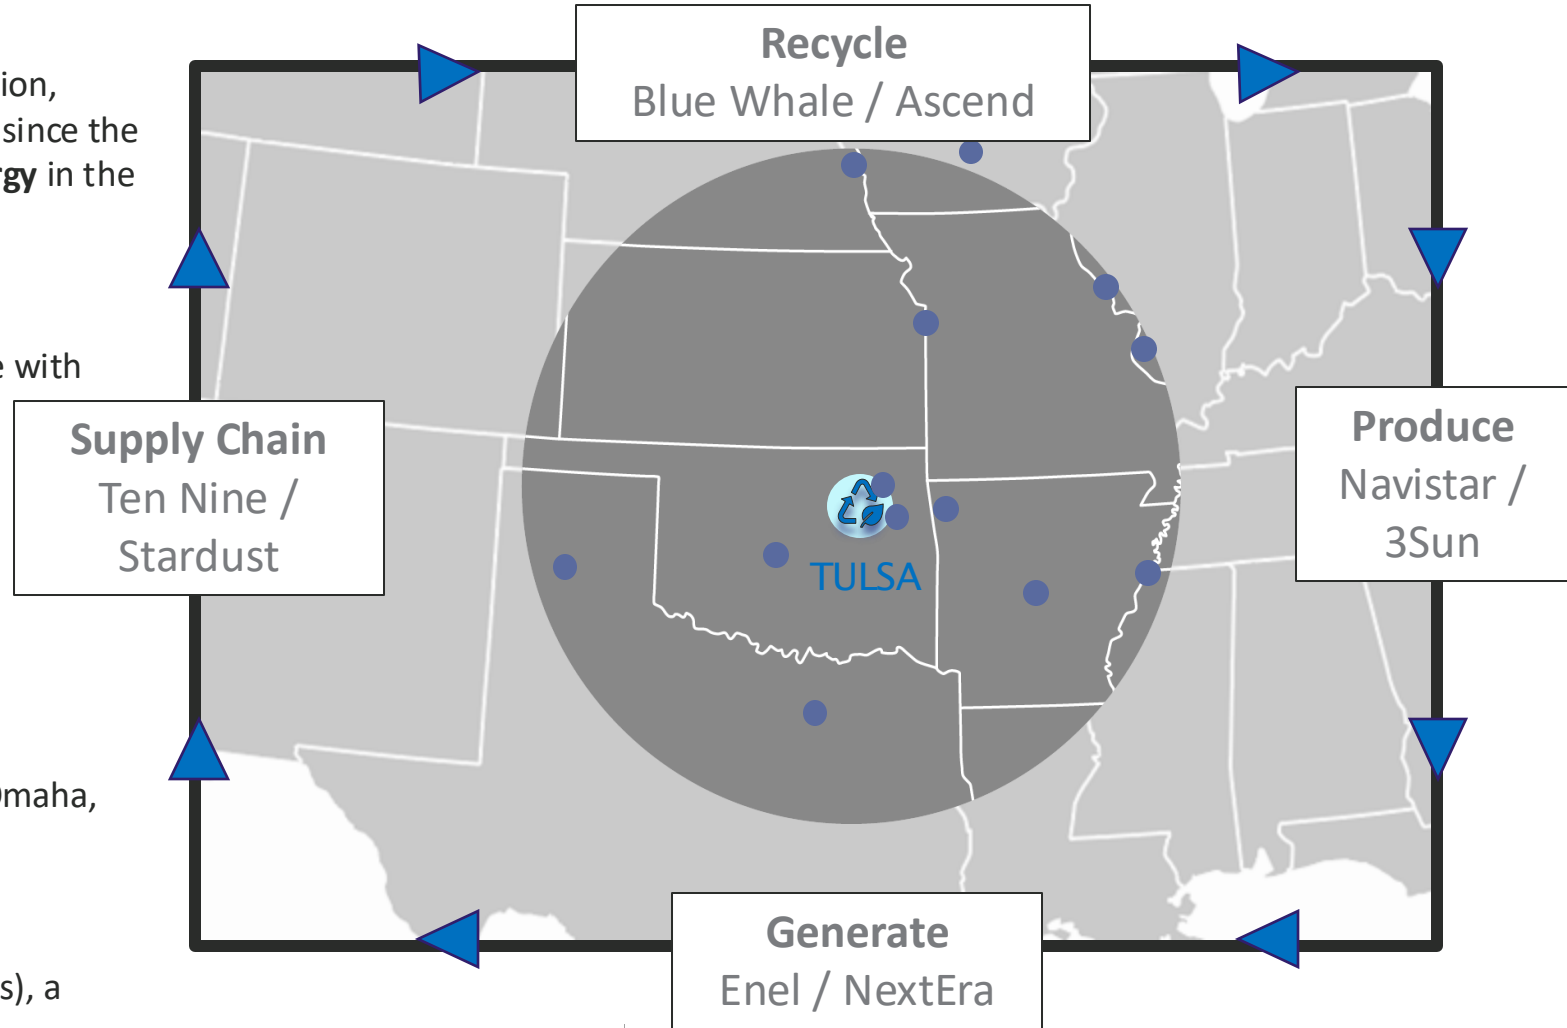

- NorSun - \$620M solar cell manufacturer
- 3Sun – \$1B photovoltaic gigafactory
- NextEra Energy – 100MW Green H2 Plant
- Navistar – Expansion of EV OEM capacity

Centrally Located

Located within 400 miles of cities with major renewable infrastructure including Dallas, Des Moines, Bentonville, Omaha, Kansas City, and St. Louis.

Transportation Hub

With access to the farthest inland ice-free port (Tulsa Ports), a robust railway system, and an interconnection of multiple highways, Tulsa is well positioned as a central point for material import and export.
