PAFOS is an extremely efficient osmotic system utilizing wave action, capturing its forces in order to generate pressure. This converts salt water into potable water through the process of reverse osmosis without the need for electricity. PAFOS can be deployed in any type of water to capture natural forces which retains the energy. The system transforms these forces into clean water for drinking, cooking, and any other fresh water needs. With the ability to be tethered and multiple systems integrated, PAFOS is the most versatile water filtration system on the planet.
