

GO PURPLE | HERO X | American Solar Challenge -- December 10, 2019

Request for Assistance

We have tested & trialed several prototype portable units, with charging capabilities both between three & four android & apple connectors each.

This is with terminals installed one full day of sunshine ahead of planned use day as a buffer storage needed prior charge.

A wireless charge table type version has been developed yet hasn't been trialed.

In the design aesthetics a visionary future goal would be to have media monitors attached & powered by the system.

Development work & prototype conceptualization has continued along with networking overlays on sites, inventory cataloguing with technical specifications being developed for rapid assembly.

As the business development has been advanced to the point where the next step for us to pin down our prototype to demo publicly, and have ready a multi-terminal network set for production & deployment upon agreement.

Thank you for your interest. Let's discuss further at your convenience.
