

THE PIEZO-SOLAR PANEL

Team: TerraCorps

The Piezo-Solar Panel combines a piezoelectric and photovoltaic system in a way that works together without hindrance.

23%

more electrical output
than modern solar
panel*

FUN FACT:

Solar cells only generate **10-25%** of their normal power output in overcast weather! This makes typical solar energy unsuitable for many climate regions in the United States.

Features of the Piezo-Solar Panel:

- The piezoelectric system (gray area of the diagram) collects energy from **ANY** natural weather phenomenon
- The panel can be customized to get the maximum amount of energy from any region in the United States.
