

RPV - RUTE Foundations

The RUTE photovoltaic system (RPV) uses raised cable trellises to provide superior support with less material and installation cost.

RPV provides an advantage for land owners by allowing dual use of land acreage for energy generation especially in pastures, agriculture tracts and vineyards.

RPV is designed for maximum efficiency. Using winches and cables, the system provides more hours of direct sunlight notably at higher elevations. 14% more energy at a 45 degree latitude can be generated with the RPV solar panel agnostic foundation.
