Automated, Auditable Accounting for the Solar Value Stack

- Solar developers spend over $2bil each year on accounting software not designed for them

- These expensive platforms require lots of manual input to create accurate bills, they require refactoring when contracts change, and are often siloed from the meter data that is needed in tandem

- Pando solves this as a flexible accounting platform which can take in your contract details and metering data, then output your financial documents automatically without dealing with the steps in the middle

- Pando also exposes the energy and financial data together for analysis and audit using modern web applications, w/o any configuration needed by the customer

- Pando's existing ability to facilitate new energy markets will complement billing and allow it to act as a turnkey customer billing solution for solar developers
